1. Introduction

Canada signed the 1982 United Nations Convention on the Law of the Sea ("the Convention") on the day it was opened for signature and ratified the Convention on 7 November 2003. The Convention entered into force for Canada on 7 December 2003.

As reflected in article 77 of the Convention, the rights of a coastal State over its continental shelf exist *ipso facto* and *ab initio*. In this respect, the Convention mirrors Canada's long-standing position, based on international law and state practice, as well as Canadian legislation and practice, regarding the exercise of its sovereign rights and jurisdiction over its continental shelf. The current definition of the continental shelf in Canadian legislation is found in section 17 of the *Oceans Act*, enacted in 1996. This definition refers to the seabed and subsoil that extend beyond the territorial sea of Canada throughout the natural prolongation of the land territory of Canada to the outer edge of the continental margin, determined in a manner under international law that results in the maximum extent of the continental shelf of Canada, or to 200 nautical miles (M) from the baselines from which the breadth of the territorial sea is measured where the outer edge of the continental margin does not extend to this distance.

Canada made a partial submission to the Commission on the Limits of the Continental Shelf ("the Commission") containing information on the limits of the continental shelf beyond 200 M from the baselines from which the breadth of the territorial sea is measured in respect of areas in the Arctic Ocean ("2019 partial submission") on 23 May 2019, thereby fulfilling its obligation pursuant to article 76(8) and article 4 of Annex II of the Convention.

This addendum to the 2019 partial submission delineates additional outer limits of continental shelf, including along the full length of the Central Arctic Plateau (Lomonosov Ridge, Alpha Ridge and Mendeleev Rise, with the intervening Podvodnikov Basin and Makarov Basin), beyond 200 M from the baselines from which the breadth of the territorial sea is measured. The addendum provides particulars of such limits with additional supporting scientific and technical data, taking into account the Scientific and Technical Guidelines, Rules of Procedure and practice of the Commission to encompass the full submerged prolongation of the Central Arctic Plateau. Noting in particular article 77, Canada reserves the right to submit information in respect of other areas or portions of its continental shelf.

This addendum and the 2019 partial submission have been prepared as a joint effort of the Department of Foreign Affairs (Oceans, Environment and Aerospace Law Division), the Department of Natural Resources (Geological Survey of Canada) and the Department of Fisheries and Oceans (Canadian Hydrographic Service). The Geological Survey of Canada and the Canadian Hydrographic Service were responsible for collecting and interpreting data, as well as preparing the submission from a technical and scientific standpoint. The Department of Foreign Affairs was responsible for legal aspects of the submission and associated diplomatic work.

Various federal departments and agencies, territorial governments, and indigenous groups and individuals assisted in the collection of data for the submission. These include Environment and Climate Change Canada (Canadian Ice Service), Parks Canada, the Canadian Coast Guard, Defence Research and Development Canada, and the Department of National Defence, as well as Canada's territorial governments of Nunavut, the Northwest Territories, and the Yukon.

While some preliminary work was undertaken in the mid-1990s, the preparation of the 2019 partial submission began after Canada became party to the Convention in 2003. In the Arctic, Canada faced the challenge of collecting data in areas that are ice-covered, difficult to access and, in most instances, had not been previously surveyed. Several of Canada's field acquisition programs included international collaboration, notably with the United States of America, the Kingdom of Denmark, Sweden and the Republic of Germany. Collaboration with foreign scientific partners were and will continue to be important relationships. Ongoing international cooperation in publishing the findings of the research contained within the submission is providing a rich and increasingly more accurate understanding of the complex geology and geological processes that have formed and shaped the Arctic Ocean.

Innovative use of technologies was also critical to enable collection of data in this harsh environment. Data collection for the purpose of the submission commenced in 2006 and concluded in 2016. Windows of opportunity for data collection in the Arctic are short and difficult due to perennial sea ice cover, weather and reduced sunlight. Ice conditions are nowhere harsher than along the Canadian continental margin where prevailing winds and currents drive multi-year ice into this sector. Despite these conditions, from ice camps and using ice breakers, Canada acquired nearly 90 000 line-km of multibeam bathymetric, sub-bottom profiler and shipborne gravimetric data, over 18 000 line-km of seismic reflection data, 8000 line-km of refraction profiling, 800 000 km² of aero-gravity and aero-magnetic data, 800 kg of rock samples dredged *in situ* from six sites and three piston cores to support its submission. These data were integrated with other information and data obtained by permission from national and international sources for both the 2019 partial submission and this addendum to it.

2. Notes

Canada's 2019 partial submission was filed on 23 May 2019. This addendum to that partial submission regarding the outer limits of the continental shelf in respect of the Arctic Ocean covers an additional area of continental shelf extending beyond the limits provided for in that partial submission, encompassing the full length of the Central Arctic Plateau.

This addendum to the 2019 partial submission by Canada in respect of the Arctic Ocean is separate from, and in addition to, Canada's earlier partial submission to the Commission in respect of areas in the Atlantic Ocean, filed on December 6, 2013.

All maps, charts and databases forming part of this submission were prepared by the three Canadian government departments responsible for defining Canada's extended continental shelf beyond 200 M. They are responsible for the data and information used in this addendum and the submission, and for certifying its quality and accuracy.

3. Commission members who provided advice during the preparation of the submission

Mr. Harald Brekke, a member of the Commission from 1997-2012, Dr. Richard Haworth, a member of the Commission from 2012-2017, and Dr. David Mosher, a member of the Commission from 2017 to present, provided advice during the preparation of Canada's 2019 partial submission. In addition, Dr. Mosher provided advice during the preparation of this addendum.

4. Provisions of article 76 invoked in support of the submission

Canada has delineated its continental shelf in the Arctic Ocean in accordance with article 76 of the Convention. In particular, Canada invoked article 76(4), (5) in determining the location of the outer limits in this submission. Canada has defined fixed points in accordance with the 1% sediment thickness formula in

CCGS *Louis S. St-Laurent*
breaking ice during the 2011
Arctic survey

article 76(4)(a)(i) or on arcs 60 M from the foot of the continental slope as provided for in article 76(4)(a)(ii), as well as on the distance constraint (350 M) and the depth constraint (2500 m plus 100 M) provided for in article 76(5). In accordance with article 76(7), the outer limits of the continental shelf have been delineated by fixed points connected by straight lines not exceeding 60 M in length.

5. Arctic Ocean

5a. General description of the continental margin in the Arctic Ocean

The continental margin of Canada in the Arctic Ocean is part of a morphologically continuous continental margin that comprises a number of extensive seafloor highs. These seafloor highs include the Central Arctic Plateau that forms the submerged prolongation of the landmass of Canada. Geological and geophysical evidence further demonstrates that the Central Arctic Plateau is continuous with the landmass of Canada and, as such, is a natural component of its continental margin. It is, therefore, considered a seafloor elevation in the context of Article 76 and the Scientific and Technical Guidelines of the Commission on the Limits of the Continental Shelf. The Central Arctic Plateau crosses the Arctic Ocean basin seaward of the Canadian Arctic Archipelago margin to where it meets the East Siberian Shelf.

The formation of the Arctic Ocean initiated with break-up of the supercontinent Pangea, involving the Precambrian cratons Laurentia, Baltica and Siberia. The break-up progressed to the Arctic Ocean in the Late Jurassic with the formation of Amerasia Basin. In Canada Basin, of the southern Amerasia Basin, rifting initiated through a series of transform motions followed by thinning and hyper-extension of continental crust. Oceanic crust formed during the Early Cretaceous in a central and comparatively small proportion of the overall basin. An extinct and buried spreading ridge trends roughly parallel to the Canadian Arctic Archipelago margin.

A multiphase period of magmatism in the north created the High Arctic Large Igneous Province (HALIP) including volcanic products with a volume of about 20 million km³ extending across an area of 1.3 million km². This magmatism coincided with, or immediately followed, opening of Canada Basin and engulfed the thinned continental crust in the present position of the Alpha Ridge and Mendeleev Rise. The main phases of magmatism persisted until at least the Late Cretaceous, and emplaced similar rock types across widespread regions of both the onshore and offshore Canadian landmass. The HALIP also formed part of the continental margin of the paleo-Barents Shelf, and dredge samples of hyaloclastic rocks demonstrate it formed in a shallow water or emergent environment.

Rifting between the Central Arctic Plateau and the Barents Shelf started in the early Paleogene, with northward progression of North Atlantic seafloor spreading into the Arctic Ocean as the Eurasian Plate rotated away from the North American Plate. The Central Arctic Plateau, therefore, remained with the North American Plate, and the modern Barents Shelf rotated away as part of the Eurasian Plate. Seafloor spreading proceeded along the Gakkel Ridge, and subsidence of the seafloor associated with the cooling oceanic crust formed Nansen and Amundsen basins of the greater Eurasia Basin. Active seafloor spreading along the Gakkel Ridge continues today, albeit at ultra-slow rates.

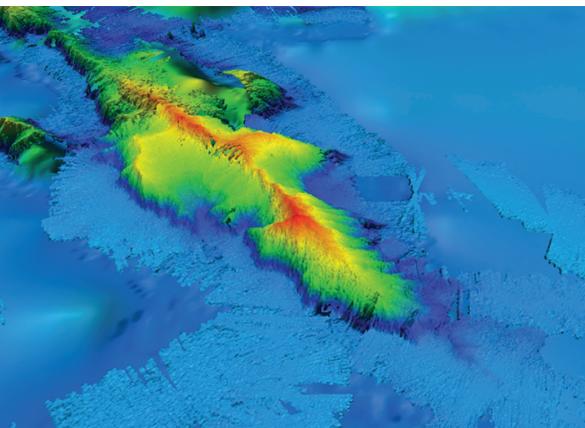

A polar bear traverses the summer ice pack in the Arctic Ocean

form part of the submerged portion of the HALIP. This flank is onlapped by turbidites of Canada Basin where it intersects the flat basin floor. The Eurasia flank of the Central Arctic Plateau (Lomonosov Ridge), where it drops elevation into the Amundsen Basin, is a sediment-starved rift margin. Its morphology largely reflects the rift tectonics that created it when the Eurasia Basin formed. Sediments of the Amundsen Basin, which appear to be a mix of levee deposits and turbidites, onlap the flank of the Lomonosov Ridge.

Multibeam bathymetry collected in the Arctic Ocean

intersection of the line delineating the outer limits of the continental shelf and the 200 M limit of neighbouring coastal States. The fixed points are joined by straight lines not exceeding 60 M in length in accordance with article 76(7). All straight lines are geodesic lines.

Of the 1111 fixed points in Canada Basin:

- 658 fixed points are defined by the 350 M ('distance') constraint line (Article 76, paragraph 5 of the Convention);

The Arctic Ocean contains a complex suite of continental margin morpho-types resulting from its tectonic history, including broad and narrow shelves, passive rift margins with varying degrees of extension/hyper-extension, volcanic margins, and transform margins. In addition, sedimentation and glacial effects have influenced various elements of the margin differently. The Canadian margin that borders Canada Basin, from the Beaufort Sea in the south and along the Canadian Arctic Archipelago, is a hyper-extended passive margin. The southern part of the margin's morphology was greatly influenced by sedimentation from the Mackenzie River that constructed a massive sedimentary fan in excess of 14 km thick with a notable bathymetric expression that is more than 200 000 km² in area. The Canadian Arctic Archipelago margin is dominated by trough-mouth fans of glacigenic debris flows generated from melting Pleistocene shelf-edge glaciers. The northern part of Canada Basin terminates at the Central Arctic Plateau. The Amerasia flank of the plateau includes Alpha Ridge and Mendeleev Rise that

5b. Description of Canada's outer limits of the continental shelf in the Arctic Ocean

The outer limits of the continental shelf of Canada, delineated in this addendum and the 2019 partial submission in respect of the Arctic Ocean, defined in accordance with article 76, paragraph 7, comprises three outer limit segments: one lying within Canada Basin; one lying within Podvodnikov Basin; and the third lying within Amundsen Basin.

In Canada Basin, the outer limits of the continental shelf are defined by 1111 fixed points (ARC-ECS-A-0001 through ARC-ECS-A-1111). Fixed points in this addendum that correspond to those already delineated in the 2019 partial submission are identified in Appendix 1. These fixed points are either formula points, established in accordance with article 76(4)(a)(i), points on the distance or depth constraint lines established in accordance with article 76(5), or points on the

- 451 fixed points are defined by the 2500 m + 100 M ('depth') constraint line (Article 76, paragraph 5 of the Convention);
- 1 fixed point (ARC-ECS-A-0001) is located on the 200 M line measured from the territorial sea baseline of the United States of America;
- 1 fixed point (ARC-ECS-A-1111) is located on the 200 M line measured from the territorial sea baseline of the Russian Federation.

In Podvodnikov Basin, the outer limits of the continental shelf are defined by 48 fixed points (ARC-ECS-B-01 through ARC-ECS-B-48) as shown in Appendix 2. These fixed points are either points on the depth constraint lines established in accordance with article 76(5), or points on the intersection of the line delineating the outer limits of the continental shelf and the 200 M limit of the Russian Federation. The fixed points are joined by straight lines not exceeding 60 M in length in accordance with article 76(7). All straight lines are geodesic lines.

Of the 48 fixed points in Podvodnikov Basin:

- 46 fixed points are defined by the 2500 m + 100 M ('depth') constraint line (Article 76, paragraph 5 of the Convention);
- 2 fixed points (ARC-ECS-B-01, ARC-ECS-B-48) are located on the 200 M line measured from the territorial sea baseline of the Russian Federation.

In Amundsen Basin, the outer limits of the continental shelf are defined by 183 fixed points (ARC-ECS-C-001 through ARC-ECS-C-183) as shown in Appendix 3. Fixed points in this addendum that correspond to those already delineated in the 2019 partial submission are identified in Appendix 1. These fixed points are either formula points, established in accordance with article 76(4)(a)(i) or (ii), points on the distance or depth constraint lines established in accordance with article 76(5), or points on the intersection of the line delineating the outer limits of the continental shelf and the 200 M limit of a neighbouring coastal State. The fixed points are joined by straight lines not exceeding 60 M in length in accordance with article 76(7). All straight lines are geodesic lines.

Of the 183 fixed points in Amundsen Basin:

- 165 fixed points are defined by arcs not more than 60 M from the foot of the continental slope (Article 76, paragraph 4(a)(ii) of the Convention);
- 6 fixed points at each of which the thickness of sedimentary rocks is at least 1 per cent of the shortest distance from such point to the foot of the continental slope (Article 76, paragraph 4(a)(i) of the Convention);
- 10 fixed points are defined by the 2500 m + 100 M ('depth') constraint line (Article 76, paragraph 5 of the Convention);
- 1 fixed point (ARC-ECS-C-001) is located on the 200 M line measured from the territorial sea baseline of Greenland (Kingdom of Denmark);
- 1 fixed point (ARC-ECS-C-183) is located on the 200 M line measured from the territorial sea baseline of the Russian Federation.

Autonomous underwater vehicle being launched from the CCGS *Louis S. St-Laurent* in 2011

Depiction of 200 M lines other than those of Canada is based on information available at the time of production and should not be taken to signify acceptance or endorsement by Canada. The establishment of the final outer limits of the continental shelf of Canada in the Arctic region will depend on delimitation between Canada and the Kingdom of Denmark, the Russian Federation and the United States of America.

5c. Maritime delimitation in the Arctic Ocean

This submission is made, consistent with article 76(10) and article 9 of Annex II of the Convention, without prejudice to future delimitation between Canada and the Kingdom of Denmark, the Russian Federation and the United States of America.

Kingdom of Denmark

During the preparation of this submission, regular consultations between Canada and the Kingdom of Denmark revealed overlaps in their respective continental shelves in the Arctic Ocean. Consequently, by an exchange of notes concluded on 25 July 2013, Canada and the Kingdom of Denmark reached an understanding that:

When one State transmits its submission regarding the outer limits of the continental shelf in the Arctic Ocean in this area of overlap to the Commission, the other State will promptly transmit a diplomatic note to the Secretary-General of the United Nations advising that it does not object to the consideration of the submission by the Commission and indicating that the recommendations made by the Commission in respect of the submission are without prejudice both to the consideration by the Commission of its own submission and to matters relating to the delimitation of boundaries between the two States. Each State will refer to this Arrangement in its submission and request the Commission to make recommendations on this basis.

Canada draws this exchange of notes to the attention of the Commission in respect of this submission and also advises that in accordance with this exchange of notes, Canada filed a diplomatic note with the Secretary-General of the United Nations on December 29, 2014 regarding the submission of the Kingdom of Denmark in respect of the Northern Continental Shelf of Greenland. Canada notes, in this regard, the diplomatic note by the Kingdom of Denmark filed with the Secretary-General of the United Nations on August 29, 2019 regarding the 2019 partial submission of Canada in the Arctic Ocean.

Russian Federation

During the preparation of this submission, regular consultations between Canada and the Russian Federation revealed overlaps in their respective continental shelves in the Arctic Ocean. Through an exchange of letters, Canada and the Russian Federation reached an understanding that:

When one State makes a submission to the Commission that includes the Arctic Ocean, the other State will promptly transmit a diplomatic note to the Secretary-General of the United Nations. The note will provide that:

- the State does not object to the consideration of the submission of the other State by the Commission;
- the State considers the recommendations provided by the Commission to the other State to be without prejudice to the Commission's consideration of the State's own submission; and
- the State considers the recommendations provided by the Commission to the other State to be without prejudice to matters relating to the delimitation of the continental shelf between the two States.

Canada notes that each State agreed to refer to this understanding in its submission. Canada draws this exchange of letters to the attention of the Commission in respect of the 2019 partial submission. Canada filed a diplomatic note with the Secretary-General of the United Nations on November 30, 2015 regarding revised partial submission of the Russian Federation in respect of the Arctic Ocean. Canada notes, in this regard, the diplomatic note by the Russian Federation filed with the Secretary-General of the United Nations on December 03, 2019 regarding the 2019 partial submission of Canada in the Arctic Ocean. Canada takes further note of the addenda to the partial revised submission in respect of the Arctic Ocean made by the Russian Federation on March 31, 2021, modifying the extent of the continental shelf overlap. In this regard, Canada considers that the understanding referred to above remains applicable.

United States of America

During the preparation of this submission, regular consultations between Canada and the United States of America revealed overlaps in their respective continental shelves in the Arctic region. Canada has been advised by the United States of America that it does not object to the consideration of Canada's submission without prejudice both to the delineation of its own shelf and to matters relating to delimitation between Canada and the United States of America. Canada, notes in this regard, the diplomatic note by the United States of America filed with the Secretary-General of the United Nations on August 28, 2019 regarding the 2019 partial submission of Canada in the Arctic Ocean.
